```
(c) \rightarrow T(1) = 1

T(n) = T(n/2) + n^2

T(n) = T(n/4) + n^2/4 + n^2

T(n) = T(n/8) + n^2/16 + n^2/4 + n^2

T(n) = T(n/2k) + (n/2k)^2 + (n/2k^{-1})^2 + (n/2k^{-2})^2 + ... (n/2)^2 + n^2

we do this until n/2k = 1 \Rightarrow n/2k = 1 \Rightarrow n = 2k \Rightarrow k = \log_2(n)

T(n) = 1 + n^2/4 + n^2/4 + n^2/8 + n^2/16 + n^2/2k \Rightarrow \text{this is a geometric series with ratio} = 1/4

T(n) = 1 + n^2/4 + n^2/4 + n^2/8 + n^2/16 + n^2/2k \Rightarrow \text{this is a geometric series with ratio} = 1/4

T(n) = 1 + n^2/4 + n^2/4 + n^2/8 + n^2/16 + n^2/2k \Rightarrow \text{this is a geometric series with ratio} = 1/4

T(n) = 1 + n^2/4 + n^2/4 + n^2/8 + n^2/16 + n^2/2k \Rightarrow \text{this is a geometric series with ratio} = 1/4

T(n) = 1 + n^2/4 + n^2/4 + n^2/8 + n^2/16 + n^2/2k \Rightarrow \text{this is a geometric series with ratio} = 1/4

T(n) = 1 + n^2/4 + n^2/4 + n^2/8 + n^2/16 + n^2/2k \Rightarrow \text{this is a geometric series with ratio} = 1/4

T(n) = 1 + n^2/4 + n^2/4 + n^2/8 + n^2/16 + n^2/2k \Rightarrow \text{this is a geometric series with ratio} = 1/4

T(n) = 1 + n^2/4 + n^2/4 + n^2/8 + n^2/16 + n^2/2k \Rightarrow \text{this is a geometric series with ratio} = 1/4

T(n) = 1 + n^2/4 + n^2/4 + n^2/8 + n^2/16 + n^2/2k \Rightarrow \text{this is a geometric series with ratio} = 1/4

T(n) = 1 + n^2/4 + n^2/4 + n^2/8 + n^2/16 + n^2/2k \Rightarrow \text{this is a geometric series with ratio} = 1/4

T(n) = 1 + n^2/4 + n^2/4 + n^2/8 + n^2/16 + n^2/2k \Rightarrow \text{this is a geometric series with ratio} = 1/4

T(n) = 1 + n^2/4 + n^2/4 + n^2/8 + n^2/16 + n^2/2k \Rightarrow \text{this is a geometric series with ratio} = 1/4

T(n) = 1 + n^2/4 + n^2/4 + n^2/8 + n^2/16 + n^2/2k \Rightarrow \text{this is a geometric series with ratio} = 1/4

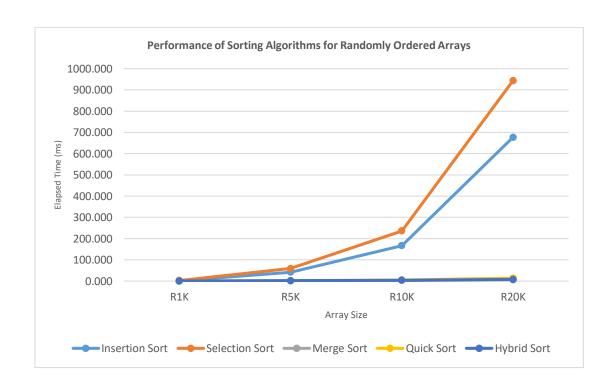

T(n) = 1 + n^2/4 + n^2/4 + n^2/8 + n^2/16 + n^2/2k \Rightarrow \text{this is a geometric series with ratio} = 1/4

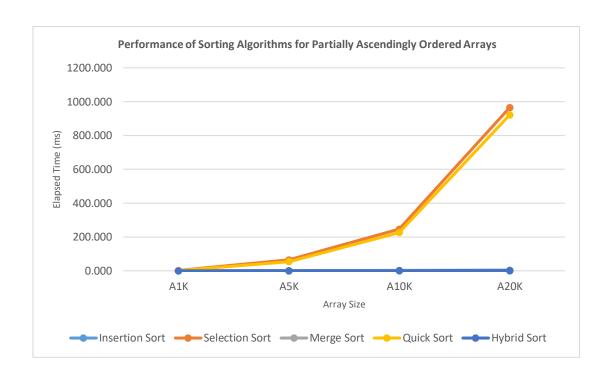

T(n) = 1 + n^2/4 + n^2/4 + n^2/8 + n^2/16 + n^2/2k \Rightarrow \text{this is a geometric series with ratio} = 1/4

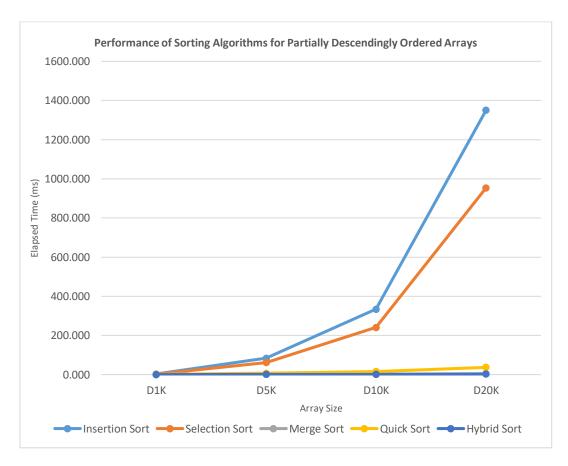

T(n) = 1 + n^2/4 + n
```

Question 3:

Array	Elapsed Time	Number of Comparisons							Number of Data Moves						
	Insertion Sort	Selection Sort	Merge Sort	Quick Sort	Hybrid Sort	Insertion Sort	Selection Sort	Merge Sort	Quick Sort	Hybrid Sort	Insertion Sort	Selection Sort Me	erge Sort	Quick Sort	Hybrid Sort

In this assignment, we were expected to write a code that records the comparison numbers, move numbers, and the time taken for the Insertion Sort, Selection Sort, Merge Sort, Quick Sort, and Hybrid Sort, a mixture of Bubble Sort-Merge Sort, which is specially prepared for this assignment. 12 different arrays with sizes 1000, 5000, 10000, 20000 and 4 of them randomly ordered, 4 of them with a partially ascending order, and 4 of them with a partially descending order were used to observe the

difference between them according to the three parameters which were specified. While the code I wrote using the <ctime> algorithm showed times below 1 ms as 0 when I ran it in the *CLion environment*, I was able to achieve more precise results when I ran the code on the command line and I included these results in the table. To analyze each sorting algorithm separately,

1. Insertion Sort:

For insertion sort, the **time complexity is O** (n^2) **for average and worst cases and O** (n) **for best case.** This is a relatively ineffective time complexity. It can be observed that the elapsed time is much larger than the other algorithms while sorting the randomly ordered array and the array with a partially descending order. However, in a scenario where the array is in an ascending order, this sorting algorithm can be useful. It was the least efficient algorithm, in terms of time while sorting partially ascending arrays. The comparison count can be a maximum of $n^2/2$ for an array of n size. We can observe that the comparison size never surpasses this limit through the table.

2. Selection Sort:

Time complexity is $O(n^2)$ for all cases for selection sort. This is a relatively ineffective time complexity and can be observed as the elapsed time is much larger than the other algorithms while sorting arrays with larger sizes (10000, 20000). It was the least efficient algorithm, in terms of time while sorting randomly ordered and partially descending arrays. The comparison count can be a maximum of n(n-1)/2 for an array of n size. We can observe that the comparison size never surpasses this limit through the table.

3. Merge Sort:

Time complexity is O (n * log (n)) for all cases for merge sort. Merge sort is a very efficient algorithm compared to the others, as can also be seen in the table. It was the most efficient algorithm, in terms of time while sorting randomly ordered arrays. Also, the comparison count is relatively smaller than the other algorithms, which makes it the superior choice over the other algorithms.

4. Quick Sort:

Time complexity is O(n * log(n)) for the average and the best-case scenarios for Quick Sort, which is similar to the Merge Sort. However as can be seen in the sorting process of the partially ascendingly ordered arrays, the Quick Sort algorithm is not efficient in this scenario, as we also choose the pivot as the first index of the array which comes with a time complexity of $O(n^2)$. The comparison count number also depends on the scenario, which makes the Quick Sort an efficient algorithm except when the array is sorted ascendingly and the pivot is chosen as the first index.

5. Hybrid Sort:

Time complexity is O (n * log (n)) for the hybrid sort due to the usage of the merge sort dominantly. In addition, while hybrid sort worked slightly less efficiently than merge sort in randomly generated arrays, it gave more efficient results in partially ascending and partially descending arrays with sizes over 1000. Therefore it was the most efficient algorithm, in terms of time while sorting partially ascending and partially descending arrays. Even though the elapsed time is small, the comparison count number and move count number are bigger than the merge sort algorithm as there is a usage of bubble sort during the sorting process.
